**CHAPTER 1  
INTRODUCTION**

---

**1-1. Purpose**

This manual is a reference handbook published as an aid in training, familiarization, and identification of land mines and mine fuzes. This manual is not authorization for requisition, stockage, maintenance, or issue of the materiel described herein.

**1-2. Scope**

a. For each item of materiel, there are illustrations and descriptions together with characteristics and related data. Included in the related data are weights, dimensions, performance data, packing, shipping and storage data, type classification, and logistics control codes (LCC).

b. Information concerning supply, operation, and maintenance of the items will be found in the publications referenced for those items. A complete listing of these publications is maintained in DA Pam 310 series indexes.

c. Within this manual, items with the following type-classifications are included:

- (1) Standard (LCC-A, LCC-B).
- (2) Contingency (CON).
- (3) Limited procurement (LP).
- (4) Reclassified obsolete (OBS) for regular Army use, but used by National Guard or Reserve units.
- (5) Reclassified OBS for all Army use, but used by Marine Corps, Air Force or Navy.
- (6) Reclassified OBS, no users, but US stocks remain. Items with the following type-classification are not included: Reclassified OBS for all U.S. use. No U.S. stocks remain. (Foreign use or stock may remain).

d. Numerical values, such as weights, dimensions, candlepower, etc., are nominal values, except when specified as maximum or minimum. Actual items may vary slightly from these values. Allowable limits can be obtained from the drawings indicated in the data sheets.

**1-3. Metric Conversion Chart**

For approximate conversions to/from metric measures see Table 1-1.

**1-4. Key to Abbreviations and Symbols**

AD .....	Anti-disturbance
AP.....	Armor piercing
APERS .....	Antipersonnel
AT/AV .....	Antitank/antivehicle
CON.....	Contingency
DCP.....	Dispenser control panel
E-CELL .....	Electrochemical cell
Frag.....	Fragmentation
HE .....	High-explosive
LCC .....	Logistics control codes
LP .....	Limited procurement
LVD.....	Low voltage detector
NM.....	Nonmetallic
OBS.....	Obsolete
SD .....	Self-destruct
VX.....	Persistent toxic (casualty) nerve gas

**1-5. Quantity-Distance Classes and Storage Compatibility Groups**

Quantity-Distance Classes and Storage Compatibility Groups. Quantity-Distance (QD) classes and Storage Compatibility groups (SCC) listed in this manual are changed. For conversion to new system see Table 1-2.

**Notes:**

<sup>1/</sup> New QD and SCG's are compatible with classes used by NATO nations.

<sup>2/</sup> Numbers in parenthesis are minimum distance x 100 feet to protect against specific fragment hazards and vary with items and types of ammunition. (Refer to TM 9-1300-206.)

<sup>3/</sup> There is no simple conversion from old SCG's to new system. The SCG groups listed in this column are typical for the majority of items in the corresponding listed QD class but do not apply to every individual item in the class. For SCG of individual items refer to TM 9-1300-206.

**CHAPTER 2**  
**ANTITANK MINES AND AERIALY DISPERSED**  
**ANTITANK/ANTIVEHICLE MINES**

**Section I. MINES, ANTITANK**

MINE, ANTITANK: HE, HEAVY, M15

AR102193

U  
AR 102194

**Type Classification:**

S 37119 (LCC-A)

**Use:**

Antitank mine M15 is intended for use against heavy tanks and other types of heavy tracked and wheeled vehicles.

**Description:**

The mine is a flat, steel cylinder with the fuze and most of the other components located concentrically with the vertical axis. Two secondary fuzing wells, threaded to accept M1 activators, are located, one in the side and one in the bottom, to provide for alternate fuzing and booby trapping arrangements. The mine, as shipped, has these wells covered with tape. The recessed knob in the M4 arming plug, located top, center, carries an arrow, and may be set to indicate Safe, Danger, or Armed, as indicated on the rim of the plug. A carrying handle, attached to the underside of the mine, is provided. The mine body houses the arming plug, pressure plate, multiple element belleville

spring primary fuze, M120 booster, and main explosive charge. The mine is shipped with fuze not assembled, with the fuze packed separately in a metal can in the packing box. Arming of the mine requires the use of the M20 wrench, with which the arming plug is unscrewed, permitting insertion of the fuze. Following removal of the safety for the fuze is inserted in the well. After verifying that the setting knob and shutter are in the Safe position, the arming plug is screwed into place and wrenched tight. The mine is armed by rotating the setting knob to the Armed position with the M20 wrench.

**Functioning:**

When the shutter of the arming plug is in the Armed position, a force of 350 to 750 pounds on the pressure plate of the mine will allow the load to be transferred to the fuze. This force activates the fuze mechanism, driving the firing pin into the detonator. This initiates the M120 booster in the bottom of the fuze well, which, in turn, detonates the main charge.

## MINE, ANTITANK: HE, NONMETALLIC, M19

## MINE, ANTITANK: HE, NONMETALLIC, M19

**Type Classification:**

S 37119 (LCC-A)

**Use:**

Antitank mine M19 is used against heavy tanks and heavy tracked and wheeled vehicles. The M19 mine is of nearly all-plastic construction and is nondetectable by magnetic mine detectors. The mine uses the mechanical pressure type fuze M606, also constructed of plastic material.

**Description:**

The mine has a square case of olive drab plastic material with both embossed and yellow markings. It can be easily identified in the dark by its box shape. The mine is packed assembled with the M606 fuze, less the detonator holder, loading assembly, which is packed separately in the same box. Two letters, A and S, on the pressure plate signify Armed and Safe, respectively. The mine body holds the high-explosive charge, the tetryl or RDX booster pellet, and the M606 fuze. There is a well, threaded to accept an M2 activator for booby

trapping in the side of the mine and another one in the bottom. In mines of early manufacture these wells are closed with plugs and gaskets, while in those of later manufacture the wells are closed with strips of adhesive tape. The fuze body contains the pressure plate, two belleville springs, setting knob, step plate firing pin assembly, and detonator. The upper belleville spring allows the fuze to function with application of predetermined force. The lower belleville spring drives the firing pin into the detonator when the pressure plate is forced downward. The setting knob turns the step plate from the Safe to Armed position and the safety clip locks the setting knob in the Safe position.

**Functioning:**

With safety clip removed and setting knob set on A, a force of 300 to 500 pounds applied to the pressure plate causes the lower belleville spring to drive the firing pin into the detonator, thus initiating the booster pellet and setting off the main charge.

## MINE, ANTITANK: HE, HEAVY, M21

## MINE, ANTITANK: HE, HEAVY, M21

**Type Classification:**

S 37246 (LCC-A)

**Use:**

Mine M21 is used primarily for destroying tanks and tracked and wheeled vehicles. It is a standoff type that can penetrate 3-inch armor plate at a distance of 21 inches. It also functions as a blast-type mine.

**Description:**

Mine M21 is composed of a cover assembly and a cylindrical steel body. The cover assembly includes the charge cap assembly with a threaded fuze hole closed by a shipping plug, a black powder charge, and the cover. The mine body contains a concave steel dish, and HE charge, firing pin, and delay assembly. The delay assembly consists of the M42 primer, a delay element, and a relay charge. A booster is placed separately in the mine and it is assembled with the mine packing box when the mine is fuzed. The M607 fuze is screwed into the mine charge cap and the extension rod

and extension rod adapter, if provided, are assembled to the fuze. The extension rod adapter was eliminated after 1963.

**Functioning:**

The fuze M607 for the mine is actuated by applying a horizontal force greater than 3.75 pounds at the end of the extension rod. The fuze is also actuated by a directly applied downward force of 290 pounds. The fuze ignites the black powder expelling charge in the mine and the resulting detonation opens up the mine cover and removes the earth covering the mine. Back pressure from the burning propellant drives the firing pin into the M42 primer which, in turn, ignites the delay assembly. After 0.15 second, the relay assembly is detonated, firing the M120 booster, which, in turn, fires the main charge. The steel dish is then driven at high velocity against the target. The arming wrench M26 is provided for use with this mine and fuze.

## MINE, ANTITANK: HE, M24

## MINE, ANTITANK: HE, M24

**Type Classification:**

S 8899 (LCC-B)

**Use:**

The antitank mine M24 is a remotely operated horizontal effects device, used to defend against tracked and wheeled vehicles. It supplements standard, vertical effects mines, in that off-route emplacement of the rocket permits mine of locations that could not otherwise be effectively mined.

**Description:**

The M24 mine has six basic components, plus auxiliary equipment, as follows:

*Discriminator Assembly, Antitank Mine M2.* This assembly consists of a 22 meter length of wire connected to an 11 meter plastic-covered pressure actuated switch. The switch is composed of four 2.6 meter segments with spacing between them. To assure operation with tracked or wheeled vehicles, pressure is required on two of the adjacent segments to close the electrical circuit.

*Rocket, HE, 3.5-inch Antitank, M28A2.* This rocket has been modified by the addition of the folding fin assembly and by splicing the leads of the rocket connecting cable to the rocket motor. The 15 meter rocket connecting cable terminates in a connector for attachment to the M61 firing device.

*Launcher, Rocket, M143.* The launcher is a 24 inch long plastic tube housing the rocket.

*Elevation and Azimuth Sighting Assembly.* The sighting and aiming equipment consists of a tube containing a peepsight and crosshairs, and a pair of self centering legs for positioning of the launcher tube.

*Firing Device, Demolition, M61.* This assembly consists of an arm/safe toggle switch together with an indicator light mounted in a box which has provision for batteries. The box is equipped with a safety cover, connectors for the discriminator assembly, and the rocket cable assembly and a transistorized firing circuit. Batteries are issued separately and are not installed until mine is being employed.

*Bipod Assembly.* This accessory provides an adjustable base for the launcher. It consists of a two-pronged base, a short vertical rod with a knurled nut which provides adjustment in elevation, and a yoke which grips the launcher tube near one end. Either forward or aft end may be chosen, depending on type of aiming correction desired. The auxiliary equipment consists of a discriminator spool and accessory pouches. The discriminator assembly is wound on the outside of the spool and the core of the spool forms an accessory compartment in which the bipod assembly, the sighting assembly, and the firing device are carried. The entire M24 mine is carried in two green nylon pouches and when strapped together they form the M190 antitank mines case. One pouch contains the rocket launcher and the other contains the discriminator spool.

**Functioning:**

A vehicle crossing the pressure switch at two adjacent segments completes the circuitry to the firing device which electrically fires the igniter in the rocket motor. The igniter initiates the propellant and launches the rocket. The fuze is initiated upon impact and penetration of the target vehicle is effected by the shape charge warhead. Although the rocket has a maximum range of 825 meters it is used in the M24 mine to cover a range up to 30 meters.

MINE, ANTITANK: HE, M66

**Type Classification:**

OBS 03866008

**Use:**

The antitank mine M66 is a remotely actuated, horizontal effects device, used to defend against tracked and wheeled vehicles. It supplements standard, vertical effects mines, in that off-route emplacement permits mining of locations that could not otherwise be effectively mined. Although, basically similar to the M24 mine, it differs in that no initiating device need be contacted by the target to function the mine.

**Description:**

The mine M66 is a system capable of delivery by parachute. It can be carried as a backpack and emplaced by one man. The mine has six basic component assemblies as follows:

*Fuze, Mine, Igniting Type, M619.* This fuze is an electronic detector/discriminator consisting of five components. The Source Assembly is a tripod mounted infra red beam generator. The Receiver Assembly is a tripod mounted infrared beam receiver. Stabilizing stakes are provided for both the Source and Receiver Assemblies. The geophone is a seismic device emplaced in the ground to sense the approach of tanks. The Data Processor, which receives inputs from the Receiver and the geophone, can analyze these and discriminates between tanks and personnel and/or animals. If the proper signal is received, the Data Processor will fire the rocket at the target. The Output Cable Assembly transmits the firing command to the rocket.

*Rocket, HE, 3.5-inch Antitank, M28A2.* This rocket has been modified by the addition of the folding fin assembly and by splicing the two leads in the firing cable and spool assembly to leads connected to the rocket motor squib.

*Launcher, Rocket, M143.* The launcher is a 24-inch-long plastic tube housing the rocket.

*Elevation and Azimuth Sighting Assembly.* The sighting and aiming equipment consists of a tube containing a peepsight and crosshairs, and a pair of self centering legs for positioning of the launcher tube.

*Bipod Assembly.* This accessory provides an adjustable base for the launcher. It consists of a two-pronged base, a short vertical rod with a knurled nut which provides adjustment in elevation, and a yoke which grips the launcher tube near one end. Either forward or aft end may be chosen, depending on type of aiming correction desired. The auxiliary equipment consists of two elongated sand bags, a protective end cover for the launcher, and a thumb screw wrench. The required batteries are issued separately.

**Functioning:**

Mine system M66 operates on the principle of remote detection and automatic functioning. The geophone detects an approaching vehicle through ground vibration and signals the data processor that a target is enroute. When the target vehicle breaks the infrared (IR) beam generated by the source assembly, the receiver signals the data processor. The processor releases electrical energy to fire the rocket only under the conditions of a broken IR beam and a proper seismic signal. This system is inhibited against personnel and animals by a filter in the data processor. Small vehicles do not normally function the system. However, the influence of small vehicles on system functioning increases in some areas depending upon closeness to geophone, speed of vehicle and terrain at the emplacement site.

MINE, ANTITANK: HE, M75

MINE, ANTITANK: HE, M75

**Type Classification:**

STD-LCC-A (LET 4-11-80, ARDC).

**Use:**

The ground burst antitank mine M75 can be emplaced only by the ground vehicle mine dispenser M128. The mine may be used in mixed minefields or by itself against heavy tanks and other types of heavy tracked and wheeled vehicles.

**Description:**

The mine is green, cylindrical in shape, and fabricated of thick-wall steel tubing. It has an internal Safing and Arming (S&A) device, an electronic assembly, and a power supply. Some of the M75 mines have an antidisturbance switch within the mine, as indicated by the last digit in the lot number. A lot number ending with a "-2" indicates that the mine has an antidisturbance switch; a lot number ending with a "-1" indicates no switch. The mine is set for a specific (normal) self-destruct time by the manufacturer; however, during operations it can be set for a long self-destruct time, depending on the mission requirement. The mines are shipped and stored in a sealed, desiccated container. The container holds eight sleeves, each containing five mines (one mine with an antidisturbance switch and four mines with no antidisturbance switch), for a total of 40 mines per container. The containers are palletized, with six containers per pallet.

**Functioning:**

Partial arming results from the angular velocity obtained as the mine travels through the launcher of the dispenser. A magnetic impulse provided by two transmitter coils located in the launcher muzzle initiates a low-order detonating primer, which activates two reserve batteries. The batteries provide the electrical power to complete the arming cycle after the mine comes to rest on the ground. The mine is completely armed in 40 to 60 seconds after launch and is then ready to detect a target.

The mine will function in response to any of the following conditions: (1) vehicle passing over the mine, (2) physical disturbance of the mine, (3) expiration of self-destruct time, or (4) power rundown.

**Section II. MINES, AERIALY DISPERSED,  
ANTITANK/ANTIVEHICLE MINES**

## MINE DISPERSING SUBSYSTEM, AIRCRAFT: M56

U  
AR 101747

**Type Classification:**

STD A MSR 09746012, dated 20 Nov. 73

**Use:**

The M56 subsystem provides the means for aerially dispensing antitank/antivehicle (AT/ AV) mines from UH-1H helicopters.

**Description:**

One complete subsystem consists of a SUU13D/A dispenser loaded with 40 canisters, each canister containing two AT/AV mines and one M198 ejection charge. The mines are in the shape of half of a 4-5/8-inch diameter cylinder and are 10-3/8 inches long. Each AT/AV mine fuze contains an electronic timing module, an electric timing module, an electric detonator, and is powered by a 7.0 volt battery. The firing train following the detonator is comprised of an RDX lead and an RDX booster pellet. Three pounds of Composition H6 constitutes the main charge of each mine.

**Functioning:**

Two subsystems are mounted per helicopter. A Dispenser Control Panel (DCP) is installed in the helicopter console which enables the pilot, or other crew member, to control the quantity and time-interval of mines fired. An electrical signal from the DCP through the dispenser intervalometer initiates an M198 ejection charge which ejects both mines from the canister. As the mines leave the canister, a bore rider pin in each mine is released which unlocks the fuze mechanical safety device. When the mines are free of the canister, spring loaded fins open which cause the mines to orient so they will land round side down. Upon impact, the mechanical safety device releases, which allows the fuze slider to move into the position which aligns the firing train. It also closes a microswitch in the fuze electrical circuit which initiates electrical arming. After ground impact, the mine may tumble and come to rest in any orientation. One to two minutes after impact, the mine is fully armed and ready to be encountered by a target. The fuze in the basic mines will initiate electrically. When a mine contains the antidisturbance (AD) feature

any overrun or agitation of a mine will cause functioning. All versions of the mine contain a self-destruct (SD) feature which has an electrochemical (E-cell) timing unit and a low voltage detector (LVD). When armed mine has not been functioned by over-run or AD, it will SD in 38 to 48 hours. Prior to SD, all mines will function if any attempt is made to remove the battery or to disrupt the battery circuit.

**CHAPTER 3**  
**ANTIPERSONNEL MINES**

## MINE, ANTIPERSONNEL: M2A4 (M2A4B2)

**Type Classification:**

OBS 11756003

**Use:**

Antipersonnel mines M2A4 and M2A4B2 are of the bounding, fragmenting-type and are used when an effective above-ground fragmentation pattern is required.

**Description:**

General. The mine consists of a steel case, with a propelling charge in the base. The combination mine fuze M6A1 is screwed into the tube attached to the base. The projectile, a modified 60mm mortar shell, is contained in the projector tube attached to the base. The propelling charge is ignited by the firing pin-primer-igniter train of the fuze. The mine is shipped with primer and igniter in place. Firing mechanism is shipped separately in fuze box and is screwed into igniter tube.

*Difference between models.* M2A4 has a stamped steel base. M2A4B2 has a cast iron base which is sealed to the projector tube and to the fuze well pipe with solder, to provide a better moisture-proof seal.

**Functioning:**

The firing mechanism is functioned either by a 3 to 10 pound pull on a trip wire or by a force of 8 to 10 pounds on one or more of the prongs protruding from the top of the fuze. This pull or push releases the firing pin which strikes the primer and initiates the firing train which ignites the propelling charge. This propelling charge ignites the delay charge and propels the projectile into the air where its delay train detonates the projectile at approximately 2 to 3 meters.

MINE, ANTIPERSONNEL: M3

MINE, ANTIPERSONNEL: M3

**Type Classification:**

OBS-11756003

**Use:**

The M3 mine is used when fragmenting, non-directional, antipersonnel mine is required. The mine is normally placed at the surface, but the effective radius can be increased if it is raised several feet above the ground. If buried, the effective radius is considerably reduced.

**Description:**

The M3 mine consists of a high explosive charge in a heavy, cast iron body. The body is filled with flake TNT and contains three threaded fuze wells to aid in booby trapping in a variety of fuzing arrangements. As shipped, fuze well holes are closed with slotted plastic plugs.

**Functioning:**

A pressure of 8 to 20 pounds on any of the prongs, or a pull of 3 to 10 pounds on the release pin ring of the

M7A1 fuze will release the firing pin to strike the primer. The primer explodes the nonelectric blasting cap, crimped to the base of the fuze, initiating the TNT bursting charge in the mine body.

**MINE, ANTIPERSONNEL, NONMETALLIC: M14**  
**MINE, ANTIPERSONNEL, NONMETALLIC: M14**

Type Classification:

S37904 (LCC-B)

Use:

Antipersonnel mine M14 is a blast-type mine and is used when small, readily concealed mines are required.

Description:

The M14 mine is cylindrical in shape, with six ribs on the outside of the body to provide strength and serve as a means of identification in darkness. The mine is of practically all-plastic construction and is detectable by magnetic mine detectors. M14 mine contains an integral pressure operated fuze. The pressure plate of the mine is designed to transfer the load to a firing pin mounted on a belleville spring. When the load reaches a predetermined value, the belleville spring snaps into reverse, driving the steel firing pin into the detonator. The pressure plate has a yellow indicating arrow and is indented to accommodate the M22 mine and fuze wrench. Letters A and S on fuze body indicate Armed and Safe, respectively. Slots in the pressure plate are for insertion of the steel U-shaped, safety clip. A pull

cord is provided for removing the clip when arming the mine. A carrying cord is also provided. For safety, the plastic detonator holder assembly with detonator is packaged separately within the same shipping container. The hole for the detonator holder assembly in the underside of the mine is closed by a plastic plug during shipment. The mine and fuze wrench is also used for removal of the shipping plug and installation of the detonator holder. A steel washer is attached to the bottom of the mine to aid in detection.

Functioning:

With mine set on A, and safety clip removed, a force of 20 to 35 pounds applied to the pressure plate will depress the belleville spring. At some point, the belleville spring snaps into reverse, driving the firing pin into the M46 detonator. This sets off the main charge.

MINE, ANTIPERSONNEL: M16 (M16A1, M16A2)

MINE, ANTIPERSONNEL: M16 (M16A1, M16A2)

**Type Classification:**

- M16 Conf. 6558
- M16A1 S 3686 (LCC-B)
- M16A2 S 3686 (LCC-A)

**Use:**

The M16 series mines are of the bounding, fragmenting type, and are employed primarily in mixed mine fields to protect antitank mines against enemy breaching parties. They can be used by themselves in the preparation of ambushes or in the nuisance mining of areas likely to be occupied by enemy troops.

**Description:**

*General.* This mine consists of a combination mine fuze M605, a propelling charge, and a cast iron, fragmenting projectile all contained in a sheet steel case. The fuze screws into the fuze well in the top of the case and extends through the projectile to the bottom of the case where the propelling charge is located. No secondary fuze wells are provided and booby trapping of the M16 series mine will be done only by specially trained personnel.

*Difference between models.* The principal difference between the M16 and M16A1 models is in the construction of the detonators and the boosters. Mine M16A2 is an advanced version of the series and incorporates only one booster detonator and delay instead of two each. This allows greater room for explosive charge.

**Functioning:**

**WARNING**

- **WHEN HANDLING THE M605 FUZE, ALWAYS TAKE CARE TO AVOID PUSHING ON THE CIRCULAR DEPRESSION IN THE BODY OF THE FUZE OPPOSITE THE TRIP WIRE PULLING BOSS. THIS IS THE SLIDER HOLDING THE FIRING PIN AND ANY MOVEMENT (EVEN THE SMALL AMOUNT ALLOWED WITH THE SAFETY COTTER PIN IN PLACE) CAN PLACE THE FIRING PIN CLOSER TO THE POINT OF RELEASE.**
- **IN ARMING THE M605 FUZE, ALWAYS PULL THE POSITIVE SAFETY PIN WITH YOUR FINGERS NOT BY PULLING JUST ON THE STRING. THIS WILL AVOID IMPARTING A SHOCK TO THE FUZE WHICH COULD ACTUATE IT.**

The M16 series firing mechanism is functioned by either a 3 to 15 pound pull on a trip wire or by a force of 8 to 45 pounds on one or more of the prongs protruding from the top of the fuze. This pull or push releases the firing pin which strikes the primer which ignites the fuze delay charge. The delay allows time for persons stepping on the prongs to move from directly above the mine. The fuze delay ignites the relay charge which ignites the fuze igniter charge. The fuze igniter charge ignites the mine propelling charge which projects the shell body upward and at the same time ignites the detonator delay charge. The detonator delay charge burns through and initiates the detonator which explodes boosters which explodes the bursting charge about one meter above the ground. The wrench M25 is furnished with this mine. The box end fits the shipping plug and the open end fits the fuze.

MINE ANTIPERSONNEL: M18A1

MINE ANTIPERSONNEL: M18A1

MINE, ANTIPERSONNEL: M18A1

MINE, ANTIPERSONNEL: M18A1

**Type Classification:**

(M18A1) S 37809 (LCC-A)

**Use:**

The M18A1 mine is used when a directional, fixed, fragmentation mine is required for the defense of bivouac areas, outposts, and against infiltration tactics. It is also used against thin-skinned vehicles.

**Description:**

*General.* Mine M18A1 has a curved, rectangular, olive drab, molded case of fiberglass-filled plastic. The front face is lined with steel spheres embedded in a plastic matrix. The back portion of the case, behind the matrix, contains C4 explosive. The fragmentation face is convex, horizontally, to direct the fragments in a 60 degree arc, and concave, vertically, to control the vertical dispersion of the fragments. A built-in sight and two pairs of scissors-type folding legs allow aiming of the mine. Two detonator wells located in the top of the mine enable the mine to be fired from two locations. The wells are sealed by the plug ends of the shipping plug priming adapters. The adapter is reversed when the mine is to be armed and the slotted end of the adapter is used to hold the blasting cap. The mine is shipped with several special components. The Cap, Blasting, Electric M4 assembly consists of an M6 electric blasting cap and 30 meters of firing wire, terminating in an electrical connector and shorting plug. The firing device is an M57 hand-held pulse generator with an electrical connector and dust cover. The test set M40 is used to visually test circuit continuity. The bandoleer M7 is constructed to carry one complete set of components.

**Functioning:**

The M18A1 mine main charge may be initiated by electrical or nonelectrical methods. The electrical method is by initiation of the electric blasting cap assembly by use of the M57 pulse generator firing device. The nonelectric method makes use of a pull type firing device operated by an observer, or by trip wires. The firing device initiates a length of detonating cord attached to a nonelectric blasting cap.

MINE, ANTIPERSONNEL: M26

MINE, ANTIPERSONNEL: M26

U  
AR 100143

U  
AR 100142

**Type Classification:**

OBS 03866012

**Use:**

The M26 mine is of the bounding, fragmenting type and is used when an effective above ground fragmentation pattern is required.

**Description:**

The M26 mine is a small, integrally fused, bounding type, antipersonnel mine. The body is of die-cast aluminum and is relatively cylindrical in shape, but tapering toward the bottom where there are four external vertical ribs. On the rim, at the top of the body, are two recesses, with a raised S for Safe in one, and a raised A for Armed in the other. The cover is built with six lugs and the prongs of the arming latch fit between these to prevent rotation. The middle prong of the arming latch fits under the trip lever cam. The arming latch is saftied to the body by an arming latch retaining pin. The cotter pin is locked, after insertion, by spreading the ends which project below the rim of the mine body. The removable trip wire spool assembly consists of four 20 foot trip wires, a trip lever, and an arming handle, all assembled on a plastic spool. The fragmenting ball assembly consists of a steel ball containing an explosive charge, and a delay and booster assembly recessed within the charge. At the base of the ball a steel obturator or piston houses the propelling charge. The barrel is used to hold the fragmenting ball assembly in an upright position. when the mine is set on Safe (S), the flash hole in the barrel is out of alignment with the primer and delay assembly. When set on Armed (A) the flash hole is alined with the primer and delay assembly and permits ignition of the propellant. The spring housing assembly includes the firing pin assembly and actuating lever, and a primer and delay assembly.

Attached to, but easily removable from the mine are the following accessories: Arming Handle, Arming Instruction Tag, Trip Lever, and Spool Assembly. Four 20 foot trip wires, two colored olive drab and two tan, are stored on the spool.

**Functioning:**

Setting the mine to the armed (A) position rotates the barrel assembly so that the primer and delay assembly are in direct alinement with the flash hole in the barrel assembly and with the expelling charge directly above. A force of 14 to 28 pounds on the mine top, or a pull on the top level will activate the mine. Upon actuation, the spring loaded firing pin is released and fires the primer and delay assembly which ignites the expelling charge. This ejects the fragmenting ball assembly to a height of approximately 2 meters. The delay, ignited by the expelling charge, then initiates the booster which detonates the main charge, shattering the fragmenting ball. The mine may be rigged for tripwire activation. Remove the trip lever from storage in the spool assembly and insert in the threaded well in the cam, top, center. Attach one or more of the tripwires, as required.

MINE, ANTIPERSONNEL: HE, M74

ARD 84-1701

**Type Classification:**

STD-LCC-A (LET 4-11-80, ARDC).

**Use:**

The ground burst antipersonnel mine M74 can be emplaced only by the ground vehicle mine dispenser M128. This mine may be used in mixed minefields to protect antitank mines against enemy breaching parties.

**Description:**

The mine is green, cylindrical in shape, and fabricated of thick-wall steel tubing which is internally scored for maintaining uniform fragment size. It has an internal Safing and Arming (S&A) device, an electronic assembly, a power supply, and four tripline assemblies at each end (eight total). The mine is set for a specific (normal) self-destruct time by the manufacturer; however, during operations it can be set for a long self-destruct time, depending on the mission requirement. The mines are shipped and stored in a sealed desiccated container. The container holds eight sleeves, each containing five mines for a total of 40 mines per container. The containers are palletized, with six containers per pallet.

**Functioning:**

Partial arming results from the angular velocity obtained as the mine travels through the launcher of the dispenser. A magnetic impulse provided by two transmitter coils located in the launcher muzzle initiates a low-order detonating primer, which activates the electrical power for mine functioning. After the mine comes to rest on the ground, a signal from the electronic assembly initiates a pressure cartridge, which causes ejection of the four tripline assemblies. The triplines uncoil from their bobbins until the tripline assemblies impact the ground. The mine is completely armed in 40 to 60 seconds after launch and is ready to detect a target.

The mine will function in response to any of the following conditions: (1) movement of a tripline, (2) physical disturbance of the mine, (3) expiration of the self-destruct time, or (4) power rundown.

MINE, ANTIPERSONNEL: M86 PURSUIT DETERRENT MUNITION (PDM)

U  
AR 2690-A

**Type Classification:**

STD

**Use:**

The M86 Antipersonnel Mine is to be hand emplaced or deployed as a deterrent munition by special forces or selected personnel only on operations where they may be pursued by an enemy.

**Description:**

The M86 Mine is similar in configuration and possesses functioning characteristics of the ADAM Mine presently loaded in the 155mm projectile, M731 (and M692). The mine is wedge shaped, and contains a safety clip, arming strap assembly, internal safing and arming device, seven tripline sensors, a reserve battery, electronic circuitry containing an IC chip, and a kill mechanism surrounded by an overlay containing a liquid propellant, and encapsulated in molded plastic form.

Functioning:

**WARNING**

- ONCE ARMING STRAP IS LIFTED, DEPLOYMENT IS MANDATORY. DO NOT ATTEMPT TO RE-SAFE.
- SAFE SEPARATION TIME IS 25 SECONDS AFTER STRAP IS LIFTED. LEAVE AREA IMMEDIATELY AFTER EMPLOYMENT AND DO NOT RETURN TO AREA.

- THE M86 MINE HAS A SELFDESTRUCT FEATURE WHICH MAKES IT EXPENDABLE: THEREFORE, DO NOT RETURN TO AREA.

- DO NOT DEPLOY MINE BELOW -25°F. IF MINE IS DEPLOYED BELOW -25°F, MINE MAY SELF-DESTRUCT EITHER IN A 5-MINUTE TIME FRAME, OR LATER THAN THE PROGRAMMED SELF-DESTRUCT TIME FRAME.

- DO NOT REMOVE NOSE PROTECTOR OR NOSE PROTECTOR TAPE. REMOVAL OF TAPE MAY DAMAGE THE ELECTROMAGNETIC RADIATION (EMR) AND ELECTROSTATIC DISCHARGE (ESD) PROTECTIVE PAINTS.

- IF ONE OR MORE TRIPLINES ARE FOUND DEPLOYED PRIOR TO USE, DO NOT ARM OR ATTEMPT TO USE THE PDM. TURN IN MINE FOR DISPOSAL.

The M86 Antipersonnel Mine is manually armed by removing the safety clip and then the arming strap assembly. A camming action breaks the shorting bar and forces the battery ball against the battery breaking the glass ampule containing an electrolyte which activates the reserve battery and provides power. The shorting bar hook, attached to the cam, shears the shorting bar (a safety device across the detonator). After a 60-second (nominal) electronic time delay, a piston actuator in the Safe and Arm mechanism is electrically fired, moving a slider to align the detonator with an explosive lead in the slider. At the same time, seven sensor triplines are released. Approximate three or four triplines will deploy up to 20 feet from the mine, depending upon the at-rest position of the mine. The remaining triplines may be hindered due to their proximity to the resting surface. After an additional 10-second electronic time delay, allowing the munition to return to equilibrium, the mine is fully armed electronically. Disturbance of a tripline, or the mine itself, now triggers a switch which completes an electronic firing circuit. The S&A electric detonator initiates the S&A firing train which initiates a detonating cord which then initiates a thin layer of liquid propellant, which by gravity rests under the kill mechanism, shattering the plastic mine body and propelling the kill mechanism upwards from 6 inches to 8 feet above the ground where it detonates. The kill mechanism is a spheroid internally embossed and loaded with 21 grams of Comp A5 and when detonated, propels fragments in a high velocity spherical pattern.

If the mine is not activated by tripline or disturbance mode, a factory preset self-destruct feature initiates the mine in 4 hours plus 0-20 percent.

**CHEMICAL AGENT MINES**

**4-1**

**Type Classification:**

S 3710 (LCC-A)

**Use:**

The chemical mine M23 is used to disperse a nerve agent (VX) and may be used as an antitank or an antipersonnel mine.

**Description:**

The chemical agent mine is prefilled, and consists of a thin-walled, steel body which houses the pressure plate assembly, a primary fuze well, and two

secondary fuze wells. The pressure plate assembly contains the pressure plate, deflection spring, fuze retainer spring, and arming plug.

**Functioning:**

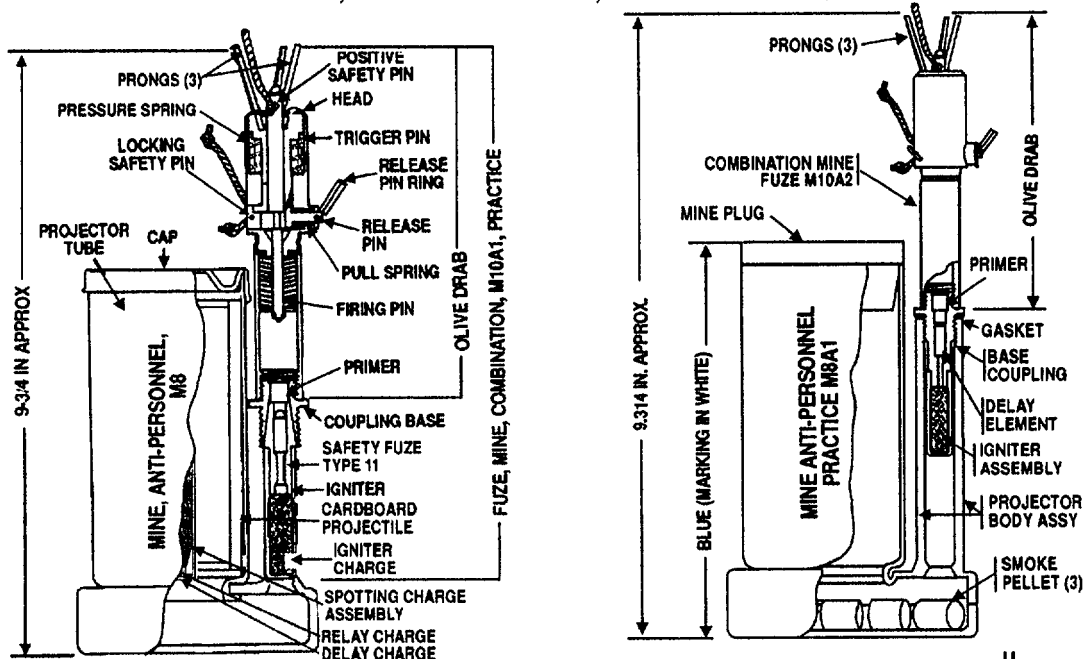

The M603 or M608 fuze is used in the primary fuze well when used as an antitank mine. When used as an antipersonnel mine, it is booby trapped by using an activator and a firing device in the side or bottom secondary fuze wells.

**PRACTICE, INERT, TRAINING,**  
**AND DUMMY ITEMS**

MINE, ANTIPERSONNEL, PRACTICE: M8 (M8A1)

MINE, ANTIPERSONNEL, PRACTICE: M8 (M8A1)

U

U  
AR 100121-A

**Type Classification:**

S 1747 (LCC-B)

**Use:**

The antipersonnel practice mines M8 and M8A1 simulate the M2 series of antipersonnel mines and are used for training in the proper methods and precautions to be observed in the care, handling, laying, booby trapping, arming, and disarming of the M2 and M15 series mines.

**Description:**

*General.* The metal parts of these mines are similar to those of service mine M2A4. The M8 mine uses a cardboard projectile containing a spotting charge. The M8A1 uses smoke pellets to indicate activation of the mine. These practice mines may be used many times by replacing the fuzes and separately requisitionable components. The M8 requires replacement of a mine cap (metal) and cardboard projectile which contains a spotting charge. The M8A1 requires replacement of a mine plug (polystyrene) and smoke pellets.

*Difference between models.* The M8 practice mine ejects a cardboard projectile containing a delay and a spotting charge of black powder which bursts in

the air. The M8A1 indicates functioning by emitting yellow smoke from the top of the main body. The practice mine M8 uses either fuze mine combination practice M10 or M10A1. The practice mine M8A1 uses the M10A2 fuze.

**Functioning:**

*Mine M8 with Fuze M10 or M10A.* The fuze firing mechanism is activated by an applied load of 8 to 20 pounds on any of the prongs or by a pull of 3 to 10 pounds of the trip wire. The fuze firing train ignites the delay element in the projectile and also propells it about 2 meters into the air. The delay initiates the spotting charge which explodes with a loud report and emits smoke.

*Mine M8A1 with Fuze M10A2.* The fuze firing mechanism is activated by an applied load of 8 to 20 pounds on any of the prongs or by a pull of 3 to 10 pounds of the trip wire. The fuze firing train ignites the yellow smoke pellets through a 4 to 5 second delay. The plastic plug is propelled in the air allowing the yellow smoke to be emitted from top of container.

MINE, ANTITANK, PRACTICE, LIGHT: M10

**Type Classification:**

OBS 11756003

**Use:**

The antitank practice mine M10 simulates the M7 series of light, inert, antitank mines and is used for training in the proper methods and precautions to be observed in the care, handling, laying, booby trapping, arming, and disarming of high explosive service antitank mines.

**Description:**

The antitank practice mine M10 consists of a rectangular, steel container, shipped empty, and is loaded with sand in the field. A primary fuze well for the practice fuze M604 is located in the top center of the mine. The smoke charge is contained in the fuze. A secondary fuze well is provided in one end of the mine for insertion of a secondary fuze for booby trapping purposes. It is taped to take any 9/16-inch threaded firing device, such as the M1 or M2, and closed with a plug to which the mine carrying cord is attached. The sand loading port is closed with a twist lock cap, supplied separately. The M10 practice mine is inert except for primer and smoke charges in the primary fuze and small charges in secondary fuze firing devices, when used. The practice fuze M604 is mounted in the top of the mine and covered by the movable striker plate of the mine and is directly activated by an external force of 120 to 240 pounds. The M10 practice mine is booby trapped with a regular firing device threaded directly into the secondary fuze well. No igniter charge or blasting cap should be used in the firing device. Practice mine M10 is activated by a force of 120 to 240

pounds on the striker plate. This force acts directly on the practice fuze M604. Functioning of the fuze ignites a smoke charge, which emits a cloud of smoke and creates a noise. When booby trapped, the mine is activated by a pull wire. Functioning of the firing device indicates activation of the mine.

MINE, ANTITANK, PRACTICE: M12 SERIES

**Type Classification:**

C 6558 (LCC-S)

**Use:**

The antitank practice mine M12 (M12A1, M12B1) is used for training personnel in the precautions and proper methods to be observed in the care, handling, laying and arming, booby trapping, and disarming of the high explosive heavy antitank mine M15.

**Description:**

The M12 practice mine is a flat, cylindrical, steel casing externally similar to the high explosive mine M15. The mine is shipped empty, with arming plug M4 assembled over the primary fuze well, but without primary or secondary fuzes. It is to be loaded with sand

and fuzed in the field. The mine is inert, but explosive components will be found in the primary fuze, and if used, in the secondary fuze and activator. The arming plug has a steel shutter which moves from a side position to a center position as the setting knob is moved from SAFE through DANGER to ARMED position. The words are appropriately color coded, green, green/red, red respectively. A wire carrying handle is provided.

**Functioning:**

Practice mine M12 is activated by a force of  $565 \pm 174$  pounds on the pressure plate of the mine. This force overcomes both mine and fuze spring systems. Functioning of the practice fuze M604 ignites a smoke charge which emits

a cloud of smoke and creates a noise. When booby trapped, the mine may be functioned by a pull or by release of trip wires attached to either of the secondary fuzes. Functioning of the secondary fuzes ignites a small smoke charge in the M1 practice activator.

MINE, ANTIPERSONNEL, TRAINING: M81

MINE, ANTIPERSONNEL, TRAINING: M81

**Type Classification:**

12816001 (LCC-A)

Box, wirebound.....7548179

**Use:**

This mine is used for training purposes only. It uses the M605 Inert Fuze and contains no explosive components. Since the dimensions are the same as the live M16A1 mine, care must be exercised not to use live components with it.

For additional pertinent details (including weight, dimensions, material, thread, fuze, temperature limits, shipping and storage data) see page 3-10.

MINE, ANTITANK: TRAINING, M80

AR 100134-A

**NOTE**

The threading of the secondary fuze wells will therefore accept the M1 or M2 activators, which should never be used. Use only the M1 practice activator, despite the lack of good fit.

**Type Classification:**

S 03788003 (LCC-A)

**Use:**

Inert mine M80 is used for training personnel in the precautions and proper methods to be observed in the care, handling, laying and arming, booby trapping (using an activator/firing device without primer), and disarming of heavy nonmetallic mine, M19.

**Description:**

This mine and fuze are completely inert (contain no explosive). They are constructed of parts identical to those used in the M19 service mine and the M606 service fuze.

**Functioning:**

There is not explosive functioning of the mine. The mine can be set on Safe or Armed by the setting knob, and the safety clip can be removed and replaced.

MINE, ANTITANK, PRACTICE: HEAVY, M20

MINE, ANTITANK, PRACTICE: HEAVY, M20

**Type Classification:**

S 36841 (LCC-A)

**Use:**

Practice mine M20 is used for training personnel in the proper methods and precautions to be observed in the care, handling, laying and

arming, booby trapping, and disarming of the high explosive, heavy, antitank mine M15.

**Description:**

The M20 mine has a squat cylindrical steel casing, externally similar to the high explosive mine M15, but differs by having three filler holes around its periphery, and perforations around the arming plug and secondary fuzeing wells, indicative of inert status. The mine is issued empty, with arming plug M4 assembled, but lacking either primary or secondary fuze. It is to be loaded with sand and fuzeed in the field. The mine is inert except for the smoke charge and M45 primer in the M604 fuze, the smoke charge primer in the M1 practice activator, and the primer in the secondary fuzeing device. The primary fuze is the fuze M604. The secondary fuze wells will accept practice antitank mine activator M1 and any firing device having 9/16 inch threading. A wire carrying handle is provided. The mine, with M604 fuze, is activated by the weight of an intermediate or heavy tank. Lighter equipment or personnel will not overcome the spring system of the mine and actuate the fuze.

**Functioning:**

Practice mine M20 is activated by a force of 565 ± 174 pounds, which is sufficient to overcome both spring systems, that in the mine, and that in the M604 fuze. Although intended for interdiction of medium or heavy tanks, the mine can be functioned, when booby trapped, by pull or release, of either of two trip wires attached to a secondary firing device. The activation of the primary fuze or either of the secondary fuzes releases a cloud or smoke and creates a noise, indicative of mine functioning.

MINE, ANTIPERSONNEL, PRACTICE: M35

**Type Classification:**  
OBS 11846007

**Use:**

The M35 practice mine is used to indoctrinate trainees in the proper handling, emplacement, arming and disarming techniques required for emplacement of the antipersonnel service mine M26.

**Description:**

The M35 practice mine is similar to the M26 mine with the following exceptions:

External - color and markings, presence of a puff port in the cover and a hexagonal socket setscrew instead of a cover locking pin.

Internal - dye capsule, simulator and panel assembly, cartridge case and sleeve assembly, spring housing retainer and spring housing assembly.

The M35 practice mine is reusable and is expected to be reloaded at least 15 times before requiring repairs. Attached to, but easily removable from the mine are the following accessories: Arming Handle, Arming Instruction Tag, Trip Lever, and Spool Assembly. Four 20-foot tripwires, two colored olive drab and two tan, are stored on the spool.

**Functioning:**

After arming, and removal of the arming latch, a weight of 14 to 28 pounds on the mine top or a pull on the assembled top lever will function the 32 caliber cartridge case. The hot gases puncture the dye capsule and cause the blue dye powder to be expelled in a discernable plume. The mine may be rigged for tripwire activation. Remove the trip lever from storage in the spool assembly and insert in the threaded well in the cam, top, center. Attach one or more of the trip wires, as required.

MINE, ANTIPERSONNEL, PRACTICE: M68

**Type Classification:**  
S 8880 (LCC-A)

**Use:**  
The M68 practice mine simulates the M18 series mines, and is used for training in the proper methods and precautions to be observed in the care and handling, booby trapping, arming, and disarming of high explosive service antipersonnel mines.

**Description:**  
The practice mine body M33 is included in a kit designated Mine, APERS, Practice, M68, which also includes the M10 practice blasting cap, the M57 firing

device and the M40 test set, all packed in the M7 bandoleer. The external appearance of the M33 practice mine is identical to the M18A1 except for color and marking. An inert filler replaces the high explosive. The M57 firing device, M7 bandoleer, and the M40 test set are the same as used with M18A1 mine. The M10 blasting cap is inert. The lead wires of the M10 are shorted to provide electrical continuity.

**Functioning:**  
The only components of the item that function are the M57 firing device and the M40 test set. There is no explosive functioning.

MINE, ANTITANK, PRACTICE: M69

**Type Classification:**

OBS 03866007  
 (Has not been produced and is not in field)

**Use:**

The M69 practice antitank mine is used for training personnel in the precautions and proper methods to be observed in the care, handling, laying, and disarming of the M66 off-route antitank mine.

**Description:**

The practice mine M69 differs from the M66 mine, which it simulates, in that the lethal mechanism, the HE rocket, is replaced by a rocket having an inert warhead M29A2. The other components of the mine are identical to the M66 mine.

ACTIVATOR, ANTITANK MINE: PRACTICE, M1

**Type Classification:**

S 36841 (LCC-A)

**Use:**

This activator is used to adapt any inert, antitank practice mine having 11/16-inch threaded secondary fuze wells to the use of a practice booby trapping firing device.

**Description:**

The practice activator is made of black plastic (newer type, blue) and has a threaded closing plug and gasket. The body is internally threaded to receive a firing device. The other end is externally threaded. The body contains a igniting charge and the cylindrical unthreaded cup end (color blue) contains the smoke charge.

**Functioning:**

This activator operates when the action of a firing device initiates the igniter charge which, in turn, ignites the smoke charge, thus releasing a puff of white smoke with accompanying noise.

**Tabulated Data:**

MINE, ANTITANK, PRACTICE: M79

ARD 84-1700

**FUZE, MINE, ANTITANK: M603, INERT**

**FUZE, MINE, ANTITANK: M603, INERT**

**Type Classification:**

S 36841 (LCC-A)

**Use:**

The M603 inert fuze is an instantaneous, mechanical, pressure-type fuze used with the inert or empty light antitank M7 series mine.

**Description:**

The M603 inert fuze body contains a firing pin assembly, a cover assembly, a safety fork (clip). The firing pin is actuated by a belleville spring.

**Functioning:**

A load of 140 to 240 pounds is required to depress the belleville spring and cause it to snap into reverse, driving the firing pin into the dummy detonator. When assembled to the mine M7A2, this activating force is received directly from the movable pressure plate of the mine. No visible or audible functioning signal is provided.

**Tabulated Data:**

**FUZE, MINE, ANTITANK, PRACTICE: M604**

**Type Classification:**

S 36841 (LCC-A)

**Use:**

Fuze M604 is used to activate the M12, M12A1, and the M20 antitank practice mines.

**Description:**

The fuze is an instantaneous, mechanical, pressure-actuated type. It consists of a steel body containing the firing pin assembly, cover assembly, primer and smoke charge and a safety fork (clip). It is issued separately and assembled to the mine in the field. After the fuze has been fired it is replaced by a new one.

**Functioning:**

A minimum force of 140 to 240 pounds depresses the pressure plate which causes the belleville spring to snap into reverse, driving the firing pin into the primer. The primer ignites the smoke composition which flashes emitting a cloud of smoke and creating a noise.

**CHAPTER 6**  
**ACTIVATORS AND FUZES**

**ACTIVATOR, ANTITANK: M1 (M2)**

**Type Classification:**

M1 S 36841 (LCC-B)  
M2 S 36841 (LCC-A)

**Use:**

Activators M1 and M2 are essentially detonator boosters and are used as adapters with any one of several kinds of pull type or pull release type firing devices to supply antitank mines with a secondary fuze for antilift/booby trapping purposes.

**Description:**

The activator bodies are made of plastic and are threaded externally to fit the 3/4-inch secondary fuze well of service antitank mines. The activators are threaded internally to accept service firing devices. The detonator is cemented within the body and a booster charge is contained in a cylindrical cup cemented to one end. Each activator is shipped with a closing plug and gasket.

*Difference between models.* Activator M1 is used with antitank mine M15 and activator M2 is used with nonmetallic antitank mine M19. Earlier M1 activators were made of black plastic, while newer types are made of olive-drab plastic. The M1 activator uses tetryl for the booster while the M2 model uses RDX.

**Functioning:**

The activator performs the function of an adapter, to fit the firing device to the mine. As a detonator booster, it increases the output of the secondary firing devices, assuring detonation of the mine main charge.

*Precautions.* Activator misfires resulting from failure of the detonator or booster to fire, may be due to excess cap sealing compound in the flash hole. Examine the cavity in the body of the activator to be sure it is free of foreign matter. At the same time, check tip of firing device, especially the flash hole, to be sure it is free of foreign matter.

**BURSTER, FIELD, INCENDIARY: M4**

**BURSTER, FIELD, INCENDIARY: M4**

11

**Type Classification:**

S 3520 (LCC-A)

**Use:**

The Burster, Field, Incendiary, M4 is used primarily to ignite field improvised incendiary munitions.

**Description:**

The M4 Burster is a tubular steel container with a cap at one end and a plug at the other, both secured by bayonet-type locking lugs. A small threaded hole in the plug is closed with a shipping plug and provides an access port for fuzing. A pyrotechnic ignition mixture, tetryl pellets and a burster cup are contained in two concentric plastic tubes preassembled within the steel burster tube. The bayonet-type locking design of the cap and plug permit the joining of two or more of the bursters, as required. Both cap and plug are sealed by means of a preformed packing.

**Functioning:**

The burster can be initiated by a fuze, blasting cap, detonating cord or any standard booby trap firing device. This initiates the explosive material in the burster cup which detonates the tetryl pellets in the inner tube. The tetryl charge sets off the pyrotechnic mixture

in the outer tube bursting the outer case of the M4 Burster.

**FUZE, MINE, COMBINATION: M6A1**

**Type Classification:**

OBS 11756003

**Use:**

Fuze M6A1 is used to activate the M2 series of antipersonnel mines.

**Description:**

Fuze M6A1 is of the combination type, with a three-pronged pressure firing device at the top and a pull wire release-pin ring at the side. The fuze body houses a spring loaded firing pin and a cocking mechanism. The igniter assembly contains a percussion cap primer and a black powder igniter. The firing mechanism consists of a cylindrical metal case containing a trigger pin, a release pin and a firing pin, each fitted with a coil spring. Two safety pins render the fuze safe during shipment and handling. A cotter pin passes through the end of the release pin and bears against the body of the fuze. A second pin, called the safety firing pin, passes through the end of the firing pin that protrudes above the top of the fuze. The base assembly containing the primer and igniter is assembled

to the mine as issued and protected by a hexagonal shipping cap. Firing mechanism is packed separately in the mine packing box. Completely assembled fuzes may also be requisitioned separately.

**Functioning:**

The firing mechanism is activated by a force of 8 to 20 pounds on any of the prongs, or a pull of 3 to 10 pounds on the release pin. Either type of action will cause the firing pin to strike the primer which initiates the igniter charge.

**FUZE, MINE, COMBINATION: M7A1**

30

**Type Classification:**

OBS 11756003

**Use:**

Fuze M7A1 is used to activate the M3 anti-personnel mine.

**Description:**

Fuze M7A1 is of the combination type, with a three-pronged pressure firing device at the top and a pull wire release-pin ring at the side. The fuze body houses a spring loaded firing pin and a cocking mechanism. The fuze base contains a primer and a crimped-on non-electric blasting cap. The firing mechanism consists of a cylindrical metal case containing a trigger pin, a release pin, and a firing pin, each fitted with a coil spring. Two safety pins render the fuze safe during shipment and handling. A cotter pin passes through the end of the release pin and bears against the body of the fuze. A second pin, called the safety firing pin, passes through the end of the firing pin that protrudes above the top of the fuze. The fuze is shipped as a complete assembly, consisting of a firing mechanism and a primed base, with a crimped-on blasting cap. When supplied with the M3 mine, the fuze is isolated, but packed within the same box. Fuzes are also packed for separate issue.

**Functioning:**

The firing mechanism is activated by a force of 8 to 20 pounds on any of the prongs or a pull of 3 to 10 pounds on the release pin. Either type of action will cause the firing pin to strike the primer which initiates the non-electric blasting cap.

**FUZE, MINE, COMBINATION: M10 (M10A1, M10A2)**

**Type Classification:**

C 6558 (LCC-S)

**Use:**

Fuze, Mine, Combination, M10 and M10A1 are used to activate the M8 antipersonnel practice mine. M10A2 is used to activate the M8A1 antipersonnel practice mine.

**Description:**

The M10 series fuzes are of the combination type with a three-pronged pressure firing device at the top and a pull wire release pin ring at the side. The fuze body houses a spring-loaded firing pin and a cocking mechanism. The base contains a primer and either a length of safety fuze or a delay composition charge. The firing mechanism consists of a cylindrical metal case containing a trigger pin, a release pin, and a firing pin, each fitted with a coil spring. Two safety pins render the

fuze safe during shipment and handling. A cotter pin passes through the end of the release pin and bears against the body of the fuze. A second pin, called the safety firing pin, passes through the end of the firing pin that protrudes above the top of the fuze. The fuze igniter assemblies (primers, safety fuzes, delays, black powder, or smoke charges) are replaceable. The fuzes may be used many times by replacing the fired igniter assembly and recocking the firing mechanism. All models are packed with the appropriate M8 mine models. The M10A1 fuze is also packed for separate issue.

*Difference between models.* Fuzes M10 and M10A1 use a primer to fire a delay safety fuze which ignites 15 grains of black powder. The M10 and M10A1 fuzes are interchangeable; their principal difference being in the primer. The M39A1 primer used with the M10A1 fuze provides more reliable functioning than the MK5 primer used with the M10 fuze. The M10A2 fuze uses the M39A1 primer and two delay composition elements to ignite a 725 mg smoke charge.

**Functioning:**

The firing mechanism is activated by a force of 8 to 20 pounds on any of the prongs or a pull of 3 to 10 pounds on the release pin. Either type of action will cause the firing pin to strike the primer which initiates the delay elements. After 4 to 5 seconds these set off the igniter charge which, in turn, initiates the mine explosive train.

**FUZE. MINE. AT: M603**  
**FUZE, MINE, AT: M603**

**Type Classification:**

S 36841 (LCC-A)

**Use:**

The M603 fuze is an instantaneous mechanical pressure-type fuze and is used with light antitank mine M7A2 and heavy antitank mine M15 and chemical agent mine M23.

**Description:**

The M603 fuze body contains a firing pin assembly, a cover assembly, a safety fork (clip), and a detinator. The firing pin is actuated by a belleville spring.

**Functioning:**

A load of 140 to 240 pounds is required to depress the belleville spring and cause it to snap into reverse, driving the firing pin into the detinator. When assembled to the mine M15, a total force of 350 to 750 pounds is needed on the pressure plate to overcome the combined resistance of the belleville springs in the mine and the fuze, and activate the fuze.

**FUZE, MINE, COMBINATION: M605**

**Type Classification:**

S 34783 (LCC-A)

**Use:**

The M605 fuze is used with the M16 series antipersonnel mines.

**Description:**

The M605 fuze is of the combination type, with a three-pronged pressure firing mechanism at the top and a pull wire release pin ring at the side. The firing mechanism is housed in a cylindrical, metal case which contains the cocking mechanism and a trigger pin, a release pin, and a firing pin, each fitted with a coil spring. The base or loading assembly contains a primer, a delay charge, a relay charge, and an igniter

charge. Two safety pins render the fuze safe during shipment and handling. A cotter pin passes through the end of the release pin and bears against the body of the fuze. A second cotter pin passes through the end of the firing pin, between the prongs. An interlocking pin between the safety pins provides additional safety. Fuzes are shipped with the M16 mines or as separate issue. A hexagonal shipping plug closes the fuze well of the mine. A fuzing wrench M25 is issued with the mine.

**Functioning:**

The M605 fuze is functioned either by a 3 to 15 pound pull on a trip wire or a force of 8 to 45 pounds on one or more of the prongs protruding from the top of the fuze. This pull, or push, releases the firing pin which strikes the primer, igniting the delay charge. The delay allows

time for persons stepping on prongs to move from directly above the mine, where their presence might inhibit the proper functioning of the mine. The delay charge ignites the relay charge which, in turn, sets off the flash igniter charge. This charge ignites the expelling charge, the first element of the mine firing train.

**FUZE, MINE, ANTITANK, NONMETALLIC: M606**

**Type Classification:**

S 37119 (LCC-A)

**Use:**

Fuze M606 is a mechanical pressure-type and is used to initiate M19 nonmetallic antitank mine.

**Description:**

Fuze M606 is a flat, round disk, constructed of plastic material to avoid discovery by magnetic mine detectors. The fuze body contains a pressure plate, two belleville springs, a setting knob, a step plate, a firing pin assembly, and a detonator holder assembly.

**Functioning:**

After the safety clip has been removed and the setting knob turned to the armed position, a force of 300 to 500 pounds on the pressure plate will depress the upper belleville spring, and cause the lower spring to

snap into reverse, driving the firing pin into the detonator.

**FUZE, MINE, ANTITANK: M607**

U  
AR 100160

AR 100161

**Type Classification:**

S 37246 (LCC-A)

**Use:**

Fuze M607 is used with antitank mine M21.

**Description:**

The M607 fuze incorporates a belleville spring-loaded firing pin, a tilt rod, a pressure ring, and a

frangible plastic collar. The base is threaded to fit the mine and is shipped with a closure assembly screwed in place for protection. Fuze wrench M26 fits the closure assembly. A safety band and strap prevents movement of the fuze pressure ring. This is secured with a cotter pin.

**Functioning:**

Fuze M607 is a pressure type fuze that can also be activated by side thrust loads, when so adapted, by the addition of an extension rod.

**FUZE, MINE, ANTITANK: M608**  
**FUZE, MINE, ANTITANK: M608**

**Type Classification:**

S 5736 (LCC-A)  
 (Has not been produced and is not fielded)

**Use:**

Fuze M608 is a direct contact, pressure-actuated fuze, containing a delay feature to provide resistance to blast-type countermeasures. It is used with antitank mine M6A2 and M15, and with chemical agent mine M23. It is suitable for use on land or in water, in temperate or tropical environments.

**Description:**

The fuze is constructed primarily of aluminum and stainless steel and consists of a fuze assembly with an integral arming cap. The fuze utilizes an out-of-line detonator system for safety and a hydraulic system to provide the delay. A spring-loaded firing pin, an M55 detonator, and a lead charge comprise the firing train. The fuze is threaded into the mine fuze well and secured by tightening the locking ring. The fuze is armed by removing the pull pin which allows the arming knob to be rotated from Safe to Armed position. This rotation aligns the input plunger with the input piston,

and allows the actuating load to be transferred to the firing mechanism.

**Functioning:**

A load of 300-600 pounds applied for 250-450 milliseconds is required to function the M608 fuze, when assembled to the M15 mine.

**FUZE, MINE: M624**

**U  
AR 2688**

**Type Classification:**

Not available (LCC-A)

**Use:**

Fuze M624 is used with Antitank Mine M15.

**Description:**

The M624 fuze consists of the M607 fuze connected to an adaptor which is loaded with a delay element. The adaptor is designed to screw into the mine fuze well. The M624 fuze incorporates a belleville spring-loaded firing pin, a tilt rod, a pressure ring, and a frangible plastic collar. A safety band and stop prevents movement of the fuze pressure ring. This is secured with a safety pin.

**Functioning:**

Fuze M624 is a pressure type fuze that can also be activated by side thrust loads, when so adapted, by the addition of an extension rod. The plastic collar within the fuze is designed to shatter under vertical loading of the pressure ring, or from side load effects on the tilt rod. A 290 pound vertical load with 1/8-inch travel, or a horizontal force on the tilt rod greater than 3.75 pounds acting through approximately 20 degrees, is required to shatter the plastic collar. Once the collar is broken, continuing force from either source will be transmitted through the tilt rod to the belleville spring, which will drive the firing pin into the PA523 detonator. This will activate the delay element which in turn will initiate the mine.

**CHAPTER 7**  
**PROJECTILES WITH ANTITANK MINES**

## PROJECTILE, 155 MILLIMETER: AT, M718 AND M718A1 WITH ANTITANK MINES

**Type Classification:**

M718 - Standard, Logistic Control Code A  
 M718A1 - Standard, Logistic Control Code A  
 MSR 04866010

mines that are ejected during projectile flight by an expulsion charge. The rotating bands are protected from damage during transportation and handling by plastic grommets.

**Use:**

These projectiles are used to deliver antitank mines in front of enemy armored forces to deny/delay access to a particular area for a specific time period. The "L" means "Long" for the long time until mine self-destructs (48 hours, nominal).

**Description:**

The projectiles are of the separate loading type (the fuzes, propelling charges, and primers are handled separately). The projectiles are shipped from the loading plant with fusible lifting plugs to facilitate handling, and as a safety measure. Before firing, the lifting plugs must be replaced with M577 series, MTSQ fuzes. The projectiles contain a payload of antitank

**Functioning:**

When the projectile is fired, the primer ignites the propelling charge which propels the round to the target area. The MTSQ fuze functions at its pre-set time setting, initiating the expulsion charge, which ejects the mines from the projectile. The mines (having been subjected to the required set-back, rotational, and set-forward forces) are armed immediately or soon after coming to rest on the ground, depending upon projectile model. Upon sensing the proximity of tanks, the mines initiate. If the mines are not initiated during their intended life span, a circuit is activated causing the mines to self-destruct. A percentage of the mines in each projectile has an antidisturbance mechanism to discourage -attempts at mine field clearing.

**Difference Between Models:**

The arming time of the mines in Projectile M718A1 is "INSTANTANEOUS" after impact. This achieves the capability of using the mines tactically in combat operations. The arming time of the mines in Projectile M718 Carriers is 58 seconds nominal. Deployment is for the laying of mine fields for denying access to critical areas. These projectiles will not be resupplied when current assets are no longer available.

 MSR 04866010

**Use:**

These projectiles are used to deliver antitank mines in front of enemy armored forces to deny/delay access to a particular area for a specific time period. The "S" means "Short" for the short time until mine self-destructs (4 hours, nominal).

**Description:**

The projectiles are of the separate loading type (the fuzes, propelling charges, and primers are handled

separately). The projectiles are shipped from the loading plant with fusible lifting plugs to facilitate handling, and as a safety measure. Before firing, the lifting plugs must be replaced with M577 series, MTSQ fuzes. The projectiles contain a payload of antitank mines that are ejected during projectile flight by an expulsion charge. The rotating bands are protected from damage during transportation and handling by plastic grommets.

**Functioning:**

When the projectile is fired, the primer ignites the propelling charge which propels the round to the target area. The MTSQ fuze functions at its pre-set time setting, initiating the expulsion charge, which ejects the mines from the projectile. The mines (having been subjected to the required set-back, rotational, and

**CHAPTER 8**  
**MINE CANISTERS**

**CANISTER, MINE: M87**

U  
AR 4335

**Type Classification:**

Standard Jan. 89

**Use:**

The M87 mine canister is used with the M139 mine dispenser (VOLCANO) to lay a mine field.

**Description:**

The M87 mine canister is an expendable item consisting of an aluminum tube and breech assembly containing five antitank mines and one antipersonnel mine. Also housed in the canister are six transmitter coils, attached to a dispersion strap, and a propulsion system. The propulsion system consists of a self-contained electrically initiated primer, and a pressure cartridge assembly containing the launching propellant. The canister is painted in green and has one colored band of yellow triangles near the breech.

**Functioning:**

When an electrical pulse is received, the electric primer initiates the pressure cartridge expelling a mine stack from the canister. The stack consists of five antitank mines and one anti-personnel mine. An interfaced web provides dispersion, self-destruct, and arm signals, set from the dispenser control unit to the mines.

**DISPENSER AND MINES**

**9-1**

## DISPENSER AND MINES, GROUND: M131

U  
AR 4515

**Type Classification:**

STD-LCC-A (6-20-86)

**Use:**

The M131 Mine Dispenser is used with the M71 Remote Control Unit (RCU) or Blasting Machine to deploy small antitank and antipersonnel minefields.

**Description:**

The M131 Mine Dispenser is a man portable, remotely controlled, antipersonnel (AP) and antitank/antivehicle (AT/AV) mine dispensing system. The mines may be deployed on command by a blasting machine hardwired to dispenser or by operating a radio frequency (RF) Remote Control Unit (RCU). The dispenser contains a battery powered Indicator Control (IC) and seven launch tubes. Each tube houses three

mines for a total of twenty-one mines per dispenser (17 AT/AV and 4 AP mines). The IC is powered by a lithium cell battery and contains the electronic package which receives, interprets, and acts on the signals received. The dispenser is designed as a self-contained shipping, storage, and deployment unit that is not reloadable once the mines have been deployed. The mine dispenser, which weighs approximately 160 pounds, is easily emplaced by four persons.

**Functioning:**

The Indicator Control in the dispenser receives command and control data from the M71 RCU when the magnetic coupling devices of the RCU and dispenser are mated together. If no data is transferred to dispenser, there will be no command and control capability once the mines are deployed. After dispenser is set to arm for 5 minutes, mines can be deployed via the M71 RCU or by a blasting machine hardwire connecting to the Indicator Control.

When the Indicator Control receives the deploy command, it will send signals to the mine Electronic Battery Initiator (EBI) to activate the mine batteries. The Indicator Control then sends control data to mines and activates actuators in dispenser to detonate cartridges to launch mines.

**Tabulated Data:**

## The Metric System and Equivalents

### Linear Measure

1 centimeter = 10 millimeters = .39 inch  
 1 decimeter = 10 centimeters = 3.94 inches  
 1 meter = 10 decimeters = 39.37 inches  
 1 dekameter = 10 meters = 32.8 feet  
 1 hectometer = 10 dekameters = 328.08 feet  
 1 kilometer = 10 hectometers = 3,280.8 feet

### Weights

1 centigram = 10 milligrams = .15 grain  
 1 decigram = 10 centigrams = 1.54 grains  
 1 gram = 10 decigrams = .035 ounce  
 1 decagram = 10 grams = .35 ounce  
 1 hectogram = 10 decagrams = 3.52 ounces  
 1 kilogram = 10 hectograms = 2.2 pounds  
 1 quintal = 100 kilograms = 220.46 pounds  
 1 metric ton = 10 quintals = 1.1 short tons

### Liquid Measure

1 centiliter = 10 milliliters = .34 fl. ounce  
 1 deciliter = 10 centiliters = 3.38 fl. ounces  
 1 liter = 10 deciliters = 33.81 fl. ounces  
 1 dekaliter = 10 liters = 2.64 gallons  
 1 hectoliter = 10 dekaliters = 26.42 gallons  
 1 kiloliter = 10 hectoliters = 264.18 gallons

### Square Measure

1 sq. centimeter = 100 sq. millimeters = .155 sq. inch  
 1 sq. decimeter = 100 sq. centimeters = 15.5 sq. inches  
 1 sq. meter (centare) = 100 sq. decimeters = 10.76 sq. feet  
 1 sq. dekameter (are) = 100 sq. meters = 1,076.4 sq. feet  
 1 sq. hectometer (hectare) = 100 sq. dekameters = 2.47 acres  
 1 sq. kilometer = 100 sq. hectometers = .386 sq. mile

### Cubic Measure

1 cu. centimeter = 1000 cu. millimeters = .06 cu. inch  
 1 cu. decimeter = 1000 cu. centimeters = 61.02 cu. inches  
 1 cu. meter = 1000 cu. decimeters = 35.31 cu. feet

## Approximate Conversion Factors
